

## 9 Creating additional files

This button allows you to create various file-types from GPX files.

File types also usable on the XT.

- Tracks. (GPX format) Tracks are created from all routes in the GPX file.  
To share your routes to users of other GPS models. (EG TomTom)
- Stripped routes. (GPX format) Contains only the Begin, End, Via and shaping points of the route.  
To force a recalculation when loaded onto the XT.
- Route points. (GPX format) Creates waypoint from all route points. (Via and Shaping)  
To be able to navigate to a specific routepoint, without using the route.
- POI. (GPI format) Creates 'Custom POI'. Custom POI's, or alerts, popup regardless of the route you're driving. They will be displayed with the correct icon, e.g. the chosen icon in Basecamp.
- Trip files. (.trip format) Creates .trip files that can be used rightaway on the XT.

The file types mentioned above will also be created as needed when you use 'Transfer to device'. The difference here is that the files will not be deleted when closing the program.

File types not usable on the XT.

- KML Files. The generated files will be usable in Google Earth, or other programs supporting this format. For example Maps.Me, Organic Maps or Google Maps.
- HTML Files. The generated HTML files can be used to share you routes to anyone who is able to open a browser.

Note: To open a KML, HTML file you can double-click on the file in TripManager. For KML you will need an application like Google Earth.
